Erik Bergbäck Knudsen

Polarization in McStas

Mcstas “particle” model recap.

Neutron ray/package:

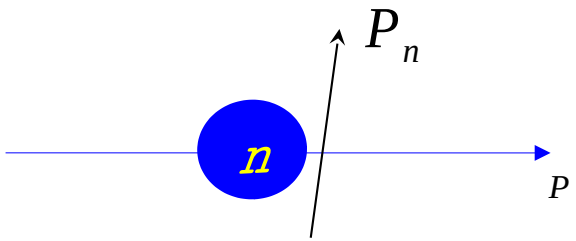
Weight: (p) # neutrons left in the package

Position: (x, y, z)

Velocity: (v_x, v_y, v_z)

Polarization: (s_x, s_y, s_z)

Time: (t)



“sub ray” level

$$P_{i,n} = 2\left(\langle \hat{s_{x,i}} \rangle \hat{i_{x,i}} + \langle \hat{s_{y,i}} \rangle \hat{i_{y,i}} + \langle \hat{s_{z,i}} \rangle \hat{i_{z,i}}\right)$$

From G. Williams: *“Polarized neutrons”, Oxford Science Publ.*, 1988

Ray level

$$P_n = \frac{1}{p_n} \sum_i^p P_{i,n}; n = raynumber$$

Beam level

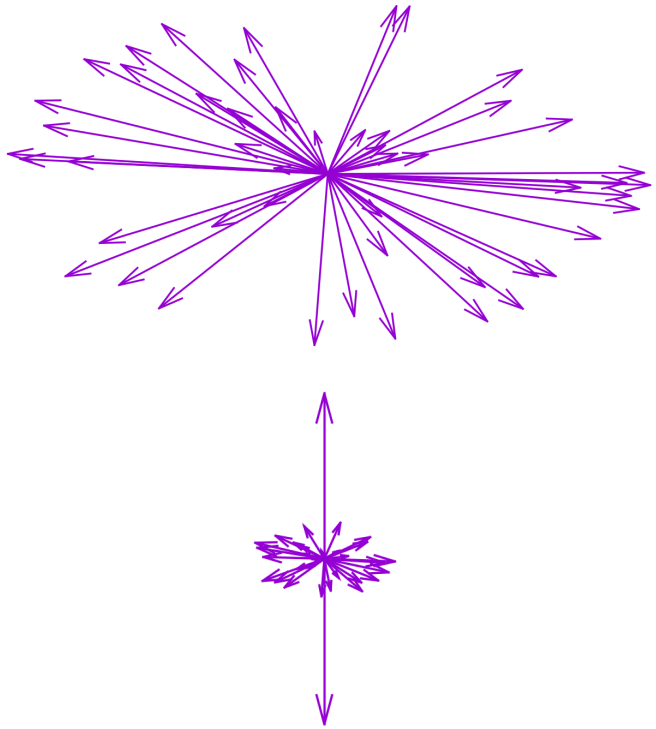
$$P = \frac{1}{N} \sum_{n=0}^{N} P_n$$

Unpolarized beam

$$\hat{s}_i = (s_x, s_y, s_z) = (0,0,0); \quad \forall\, \hat{s}_i$$

$$\bar{s} = random\ unit\ vector$$

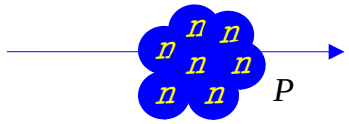
$$\left|\sum \bar{s}\right| = 0$$



Complete polarization information in each ray

McStas polarization detectors/monitors

Monitoring: How and What do we monitor?



$$P_{\hat{h}} = \frac{\sum_{n=0}^{N} p_n P_n \cdot \hat{h}}{\sum_{n}^{N} p_n}$$

Polarization components in McStas 2.7

Magnetic fields:
- `Pol_FieldBox.comp`
- `Pol_constBfield.comp`
- `Pol_Bfield.comp`
- `Pol_Bfield_stop.comp`
- `Pol_triafield.comp`

Monitors:
- `Pol_monitor.comp`
- `MeanPolLambda_monitor.comp`
- `PolLambda_monitor.comp`

Contrib:
- `Foil_flipper_magnet.comp`
- `Single_magnetic_crystal.comp`

Sample:
- `Single_magnetic_crystal.comp`

Optics:
- `Monochromator_pol.comp`
- `Pol_bender.comp`
- `Pol_guide_vmirror.comp`
- `Pol_mirror.comp`
- `Pol_pi_2_rotator.comp`
- `Transmission_polarisatorABSnT.comp`
- `Pol_bender_tapering.comp`
- `Pol_straight_tapering.comp`
- `He3_cell.comp`
- `RF_flipper.comp`

Idealized components:
- `PolAnalyser_ideal.comp`
- `Set_pol.comp`

Polarization monitors

Available monitors:

- `Pol_monitor.comp`: 0D
- `PolLambda_monitor.comp`: 2D
- `MeanPolLambda_monitor.comp`: 1D

In the repo for next release

- `PolTOF_monitor.comp`: 2D

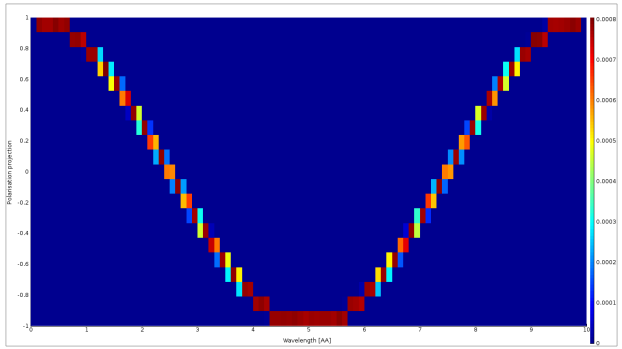
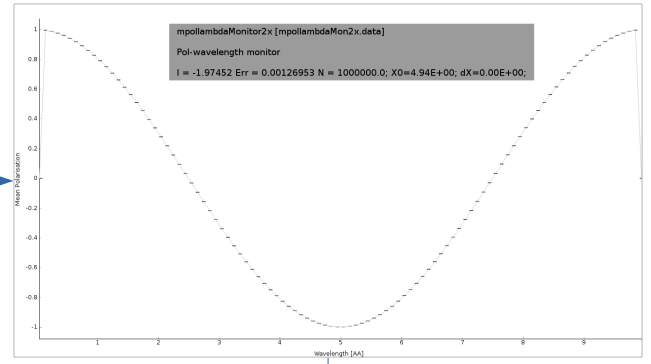
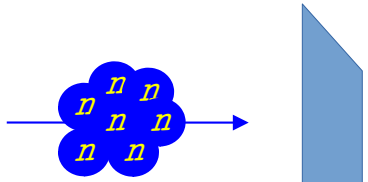
PolLambda_monitor



MeanPolLambda_monitor





Pol_monitor

$$P\left\|\left(m_x, m_y, m_z\right)\right. = 0.87$$

McStas precession algorithm

- Magnetic fields in McStas
- The challenge:
  - Fast beam/ray transport: *rays* $>10^6$
  - Unknown magnetic field and field strength
  - >1 Magnet → nested fields.

McStas precession algorithm

while $n_t < t_{target}$ **do**
  store neutron;
  sample magnetic field: $\mathbf{B}_1 = \mathbf{B}(n_x, n_y, n_z, n_t)$;
  propagate neutron: $\delta t (< \Delta t)$;
  sample magnetic field: $\mathbf{B}_2 = \mathbf{B}(n_x, n_y, n_z, n_t)$;
  while $|\mathbf{B}_1 - \mathbf{B}_2| > \delta B_{threshold}$ **do**
    restore neutron;
    $\delta t := \delta t / 2$;
    propagate neutron: $\delta t (< \Delta t)$;
    sample magnetic field: $\mathbf{B}_1 = \mathbf{B}(n_x, n_y, n_z, n_t)$;
  precess polarization: $\mathbf{P_n}$ by ω around $\frac{\mathbf{B}_1 + \mathbf{B}_2}{2}$;

Algorithm 1: SimpleNumMagnetPrecession: Simplistic algorithm for tracking polarization of a Monte-Carlo neutron in a magnetic field. The neutron's state is stored as a position (n_x, n_y, n_z), a velocity $\mathbf{v}$, time n_t, and polarization vector $\mathbf{P_n}$.

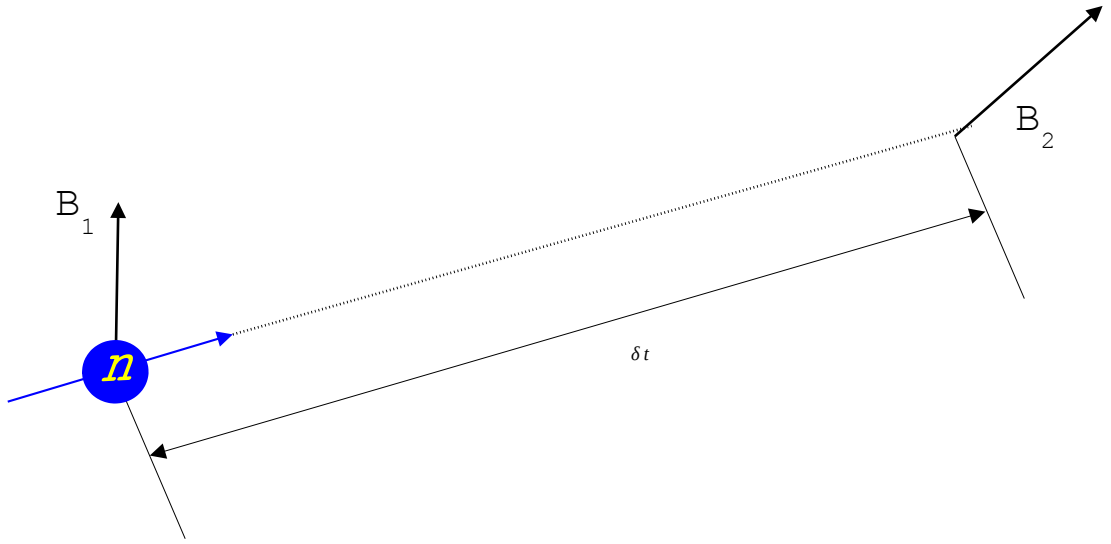
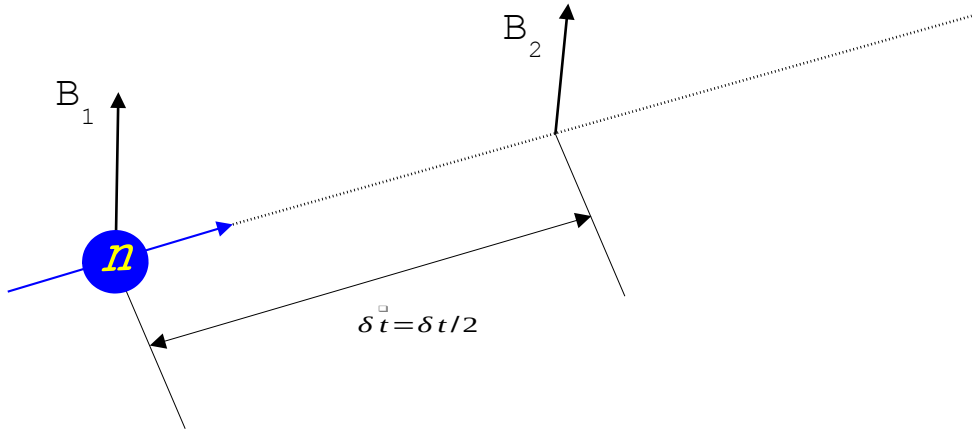
McStas precession algorithm

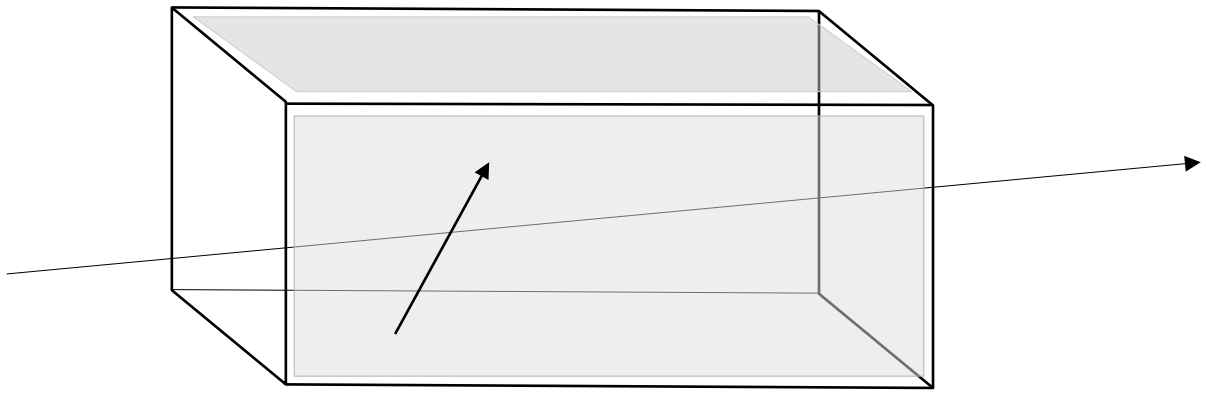


McStas precession algorithm



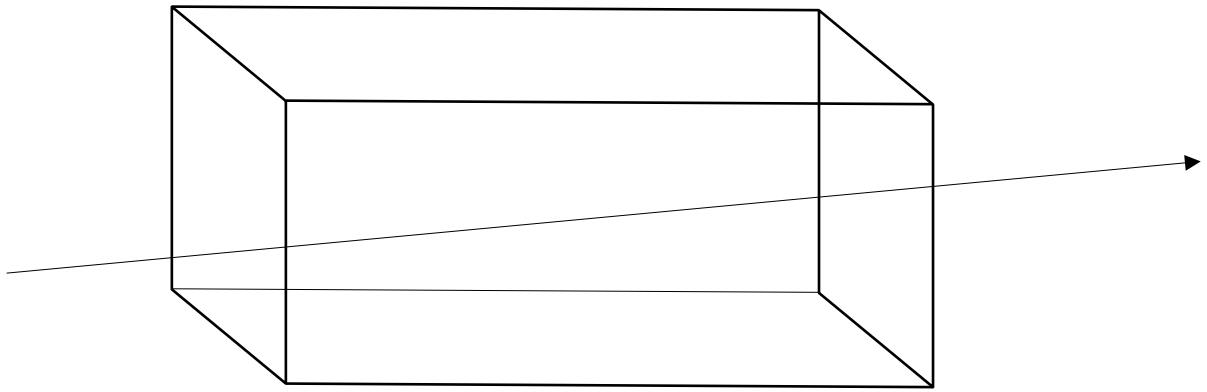
McStas magnetic fields

- `Pol_constBfield.comp`
- Single constant Magnetic field in a "box".
- - user may specify a wavelength to flip.
  - blocking walls



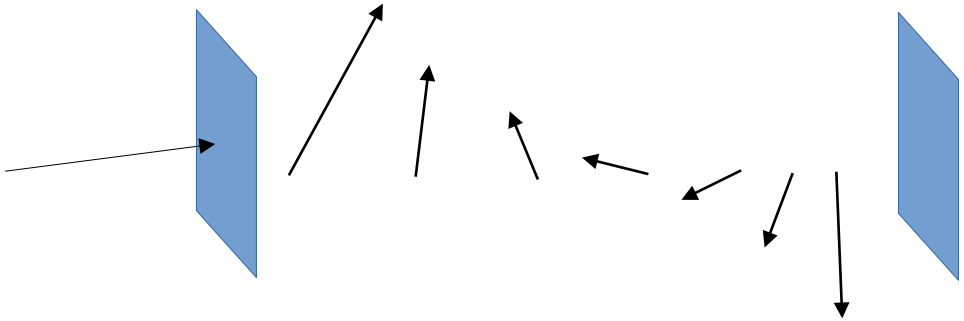
McStas magnetic fields

- `Pol_FieldBox.comp`
- Single Magnetic field in a “box”
- - optional user supplied field c-function



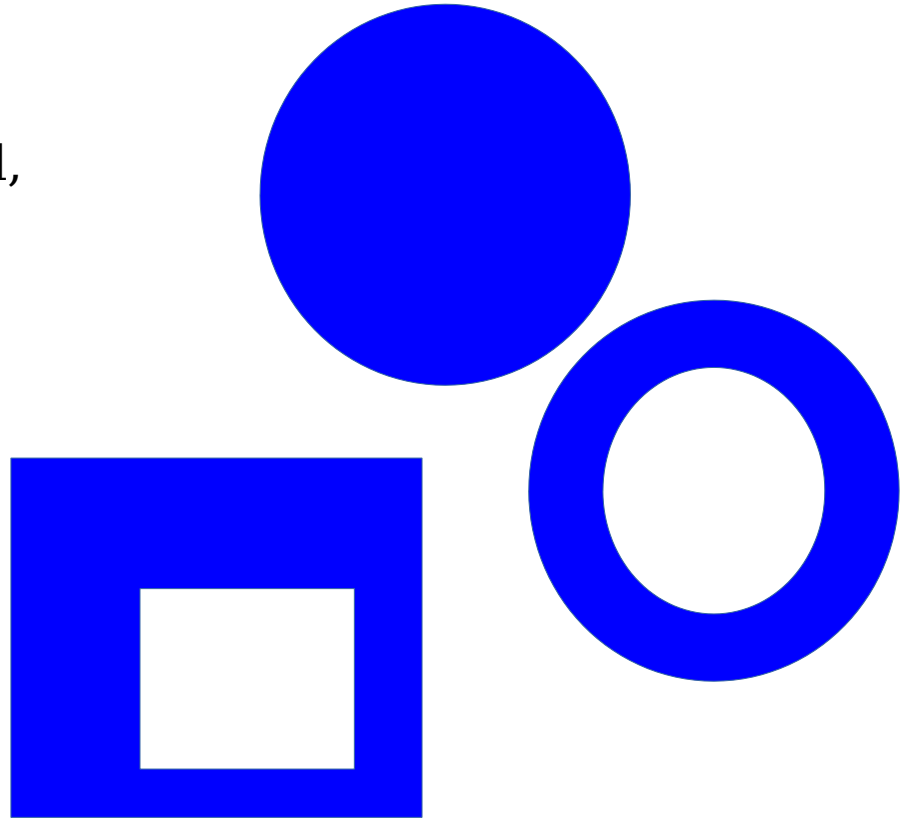
McStas magnetic fields

- `Pol_Bfield.comp`
- `Pol_Bfield_stop.comp`
  - - Entry/Exit contruction allows for nested magnetic field descriptions.
    - Any magnetic fields through user supplied c-function
    - Tabled magnetic fields



Windows can be many shapes

B-Fields: constant, functional, tabled,
… in more general shapes



McStas Polarization Capabilities IV

- `Pol_Bfield.comp`
- `Pol_Bfield_stop.comp`
  - - Entry/Exit contruction allows for nested magnetic field descriptions.
    - Any magnetic fields through user supplied c-function
    - Tabled magnetic fields
