```

Parameters from the PSI cold source

Intensity at a given wavelength drawn from a sum of (up to) 3 normalized Maxwellian distributions:

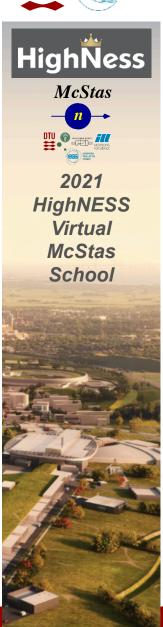

$$I(\lambda) = \sum I_i M(\lambda, T_i); \qquad M(\lambda, T_i) = 2\alpha^2 exp\left(\frac{-\alpha}{\lambda^2}\right)/\lambda^5;$$

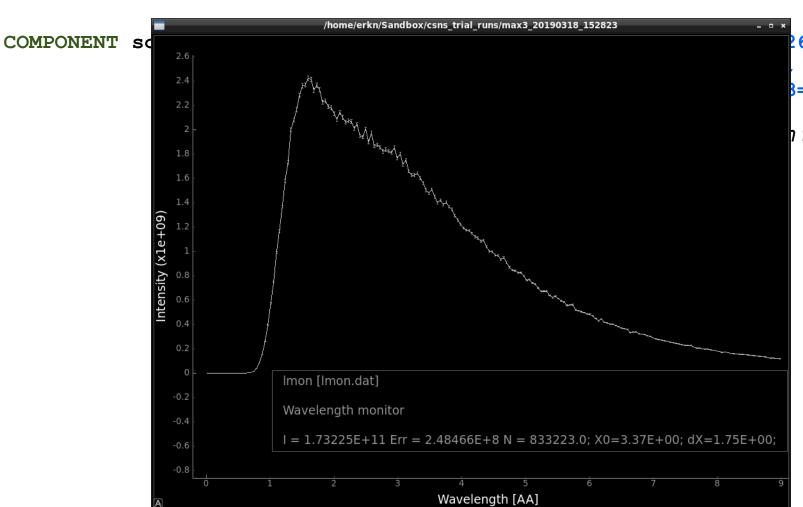

$$\alpha = 949.0KAA^2/T_i$$

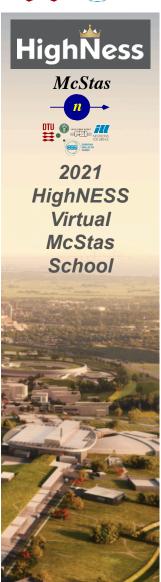

focus\_yh = 0.12, B=14.84, I3=0.95E11)

the PSI cold source

# Sources: Source\_Maxwell\_3

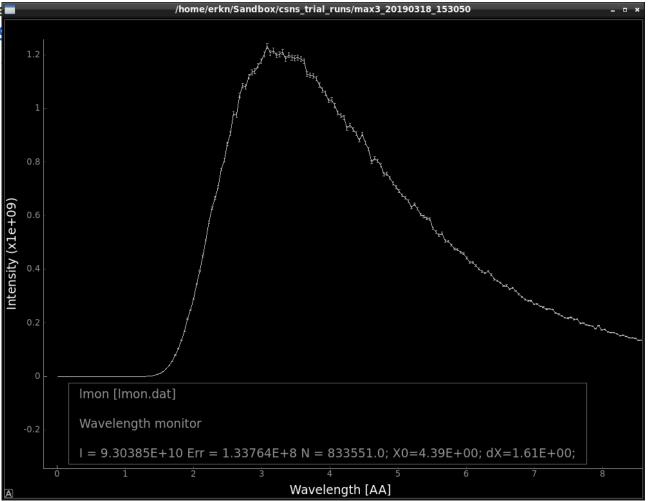

COMPONENT source = Source Maxw

Lmin=0.1, Lmax=9
T1=150.42, I1=3

Just for fun – let's see what happens if we remove the fast peak...

#### Input parameters

HighNessParameters in **boldface** are required; the others are optional.

2021
HighNESS
Virtual
McStas
School

Parameters in <b>boldface</b> are required; the others are optional.			
Name	Unit	Description	Default
size	m	Edge of cube shaped source (for backward compatibility)	0
yheight	m	Height of rectangular source	0
xwidth	m	Width of rectangular source	0
Lmin	AA	Lower edge of lambda distribution	
Lmax	AA	Upper edge of lambda distribution	
dist	m	Distance from source to focusing rectangle; at (0,0,dist)	
focus_xw	m	Width of focusing rectangle	
focus_yh	m	Height of focusing rectangle	
T1	K	1st temperature of thermal distribution	
T2	K	2nd temperature of thermal distribution	300
T3	K	3nd temperature of	300
I1	1/(cm**2*st)	flux, 1 (in flux units, see above)	
I2	1/(cm**2*st)	flux, 2 (in flux units, see above)	0
I3	1/(cm**2*st)	flux, 3	0
target_index	1	relative index of component to focus at, e.g. next is +1 this is used to compute 'dist' automatically.	+1
lambda0	AA	Mean wavelength of neutrons.	0
dlambda	AA	Wavelength spread of neutrons.	0

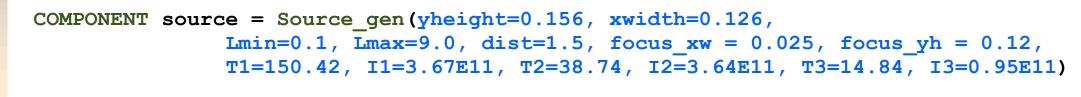

HighNess

**McStas** 

# Sources: Source\_gen (Source\_gen4)

Almost the same as Source\_Maxwell\_3: but with optional flux-files as input.

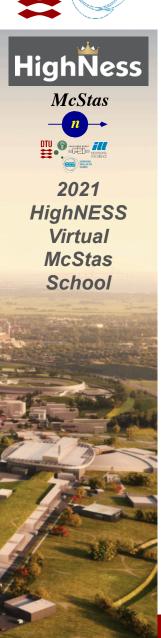

\*\*\*\*

# MCPL\_input/output

Reads/writes events directly from MCPL-format files:

(Xin, Yin, Zin) RELATIVE PREVIOUS

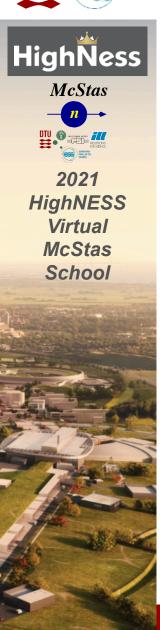

"T. Kittelmann et. al., "", J. Phys. Comp., 2017

\*\*\*\*

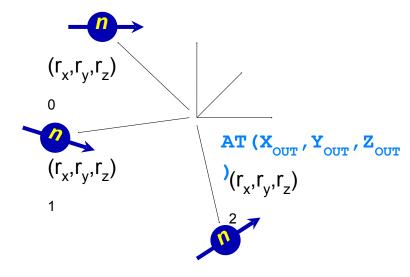

# MCPL\_input/output

Can include an Implicit Translation:

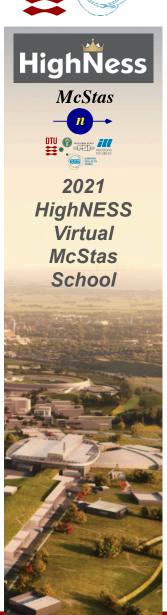

#### MCPL\_output.comp

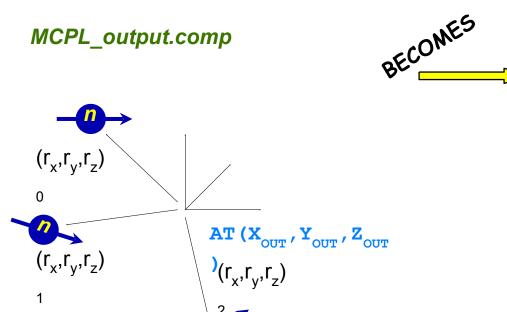

# MCPL\_input/output

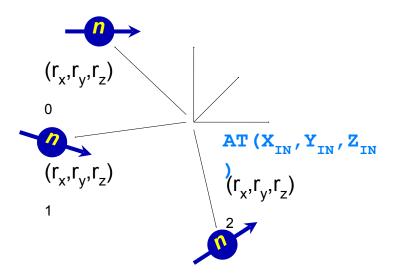

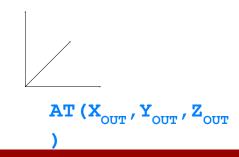

Can include an Implicit Translation:

MCPL\_output.comp

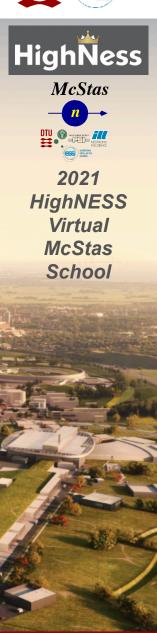

MCPL\_input.comp

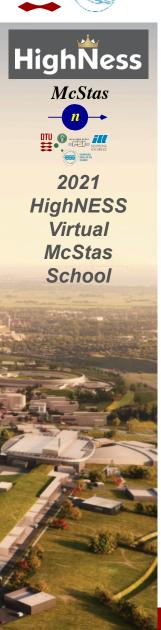

#### **Pulsed sources:**

Simplest case: Use a continuous source! Model a source with given wavelength and spatial distribution and ... an infinitely short pulse length. I.e. t = 0 for all neutron rays. COMPONENT src = Source simple( radius=0.05, lambda0=2.5, dlambda=1.5, focus\_xw=0.1, focus\_yh=0.1, dist=5 )

AT(0,0,0) RELATIVE origin

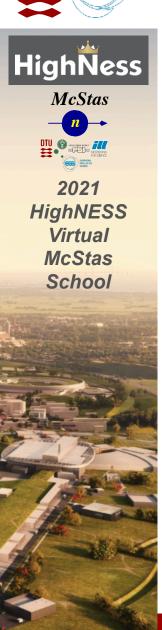

#### **Pulsed sources:**

```
Simplest case:
         Use a continuous source!
         Model a source with given wavelength and spatial distribution
         and
           an infinitely short pulse length. I.e. t = 0 for all neutron rays.
        COMPONENT src = Source simple(
                 radius=0.05, lambda0=2.5, dlambda=1.5,
                 focus_xw=0.1, focus_yh=0.1, dist=5 )
        AT(0,0,0) RELATIVE origin
        EXTEND
        응 {
```

t=0;

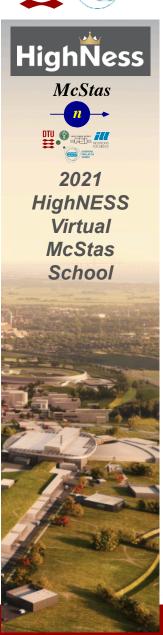

#### **Pulsed sources:**

```
Simplest case:
         Use a continuous source!
         Model a source with given wavelength and spatial distribution
         and
                  Or: Use a chopper (see later)
           an infinit
                                                       tron rays.
        COMPONENT
                                                dlambda=1.5,
                 rad
                                  focus_yh=0.1, dist=5 )
                 focu
        AT(0,0,0) RELATIVE origin
        EXTEND
        왕 {
                 t=0;
```

#### **Pulsed Sources: Moderator**

A flat pulsed source with uniform energy spectrum:

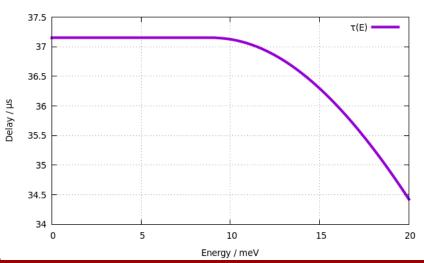

$$x \in U\left[-\frac{xwidth}{2}, \frac{xwidth}{2}\right] y \in U\left[-\frac{yheight}{2}, \frac{yheight}{2}\right]$$

$$|v| = f(\lambda); \lambda \in U\left[L_{min}L_{max}\right]$$

Time structure is given by energy dependent probability density function:

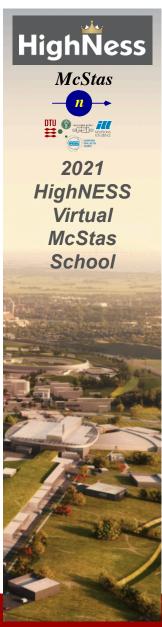

$$f_{t} = \frac{1}{\tau} exp\left(-\frac{t}{\tau}\right)$$

$$\tau = \begin{cases} t_{0}; & E < E_{c} \\ t_{0}\left(\frac{1}{1 + \frac{(E - E_{c})}{\gamma}}\right); & E \ge Ec \end{cases}$$

#### Pulsed Sources: ViewModISIS

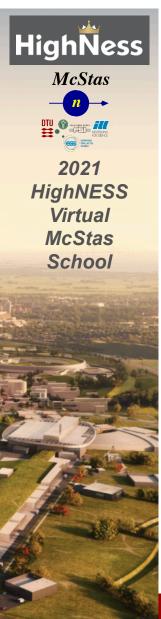

Samples directly from tallies coming from e.g. MCNP target+moderator calculations.

Data file supplied for each beam port at ISIS.

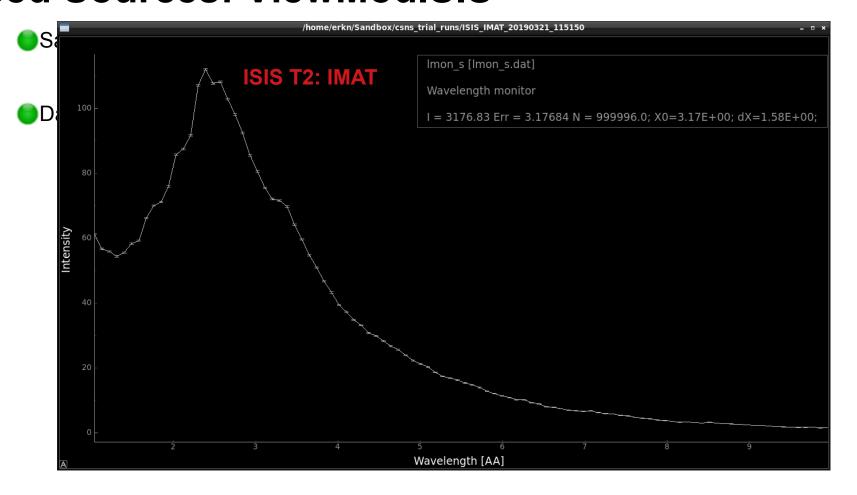

\*\*\*\*

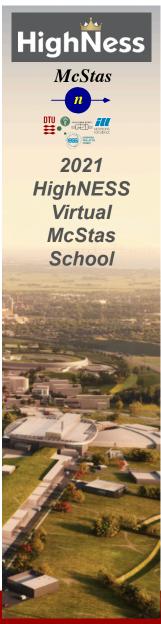

#### Pulsed Sources: ViewModISIS

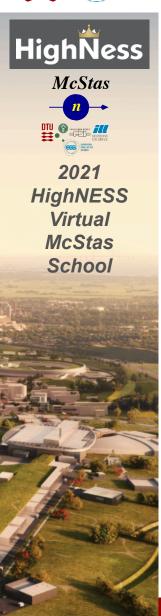

# Pulsed Sources: SNS\_source

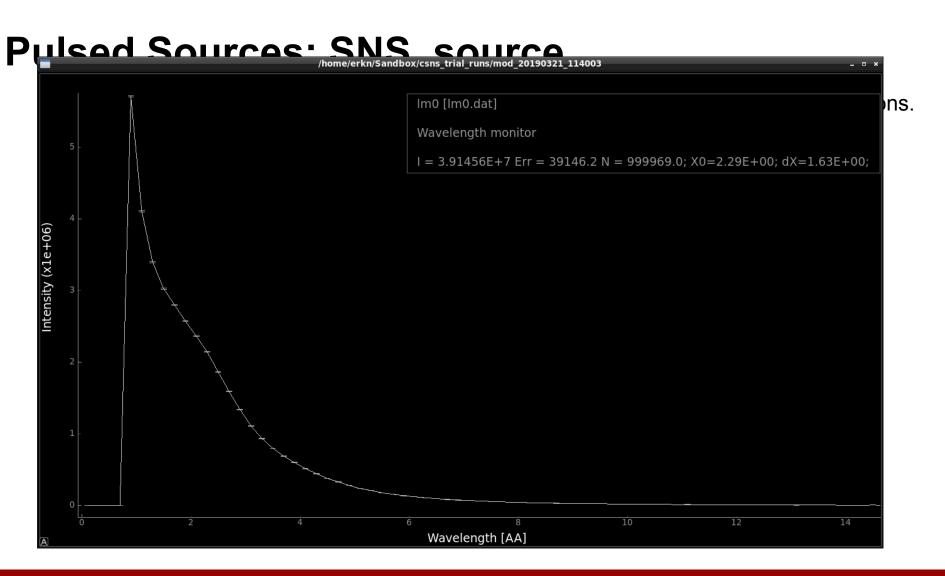

- Samples directly from tallies coming from e.g. MCNP target+moderator calculations.
- Originally from SNS but also used extensively at J-PARC
- Can be used (with the proper input files) to model CSNS, and likely also ISIS.

\*\*\*\*

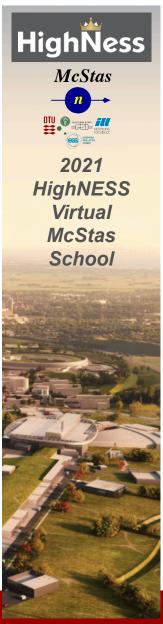

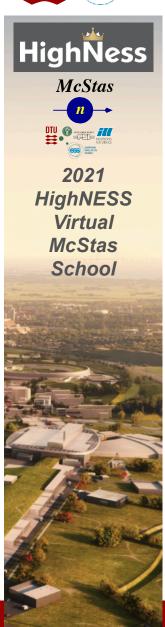

# Pulsed Sources: SNS\_source\_analytic

- Samples from fits of Padé-functions to tallies from SNS\_source.
- Requires a complex fitting campaign
- + Much faster than SNS\_source
- + "Cleaner" distributions where statistics are sketchy
- Can be used (with the proper input files) to model CSNS-source.

\*\*\*\*

# Monitors (some)

- $\clubsuit$ L\_monitor  $\rightarrow I(\lambda)$
- $\Rightarrow$ TOF\_monitor  $\rightarrow I(t)$
- $\bigoplus$ Hdiv\_monitor  $\rightarrow I(div_x)$
- $\clubsuit$ E\_monitor  $\rightarrow I(E)$

#### **2**D

- $\bigcirc$  PSD\_monitor  $\rightarrow$  I(x,y)
- $\bigcirc$  PSD\_monitor\_4PI  $\rightarrow$   $I(\theta, \phi)$
- $\bigcirc$  PolLambda\_monitor  $\rightarrow I(\bar{P}, \lambda)$
- $\bigcirc$  Divergence\_monitor  $\rightarrow I(\text{div.}_x, \text{div.}_y)$
- $\bigcirc$  DivPos\_monitor  $\rightarrow I(\text{div.}_x, x)$

#### nD

$$\bigcap_{I(X)} Monitor\_nD \rightarrow$$

or

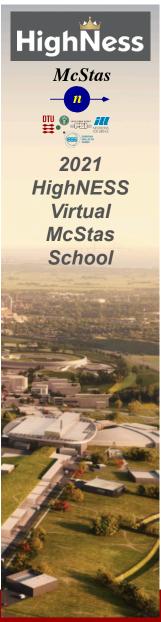

I(X, Y) or

Z(X, Y, Z)

or ...

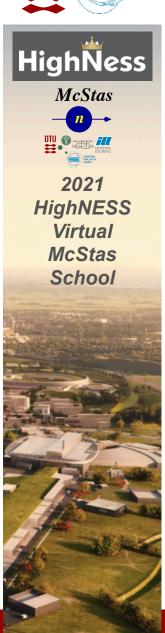

# **Monitors: Quick examples**

```
COMPONENT my_L_monitor = L_monitor(xwidth=0.2, yheight=0.2, nL=20, filename="Output.L", Lmin=2, Lmax=10)
```

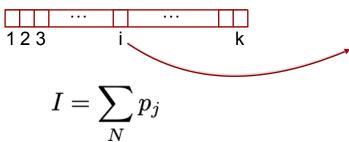

# In a histogram sense

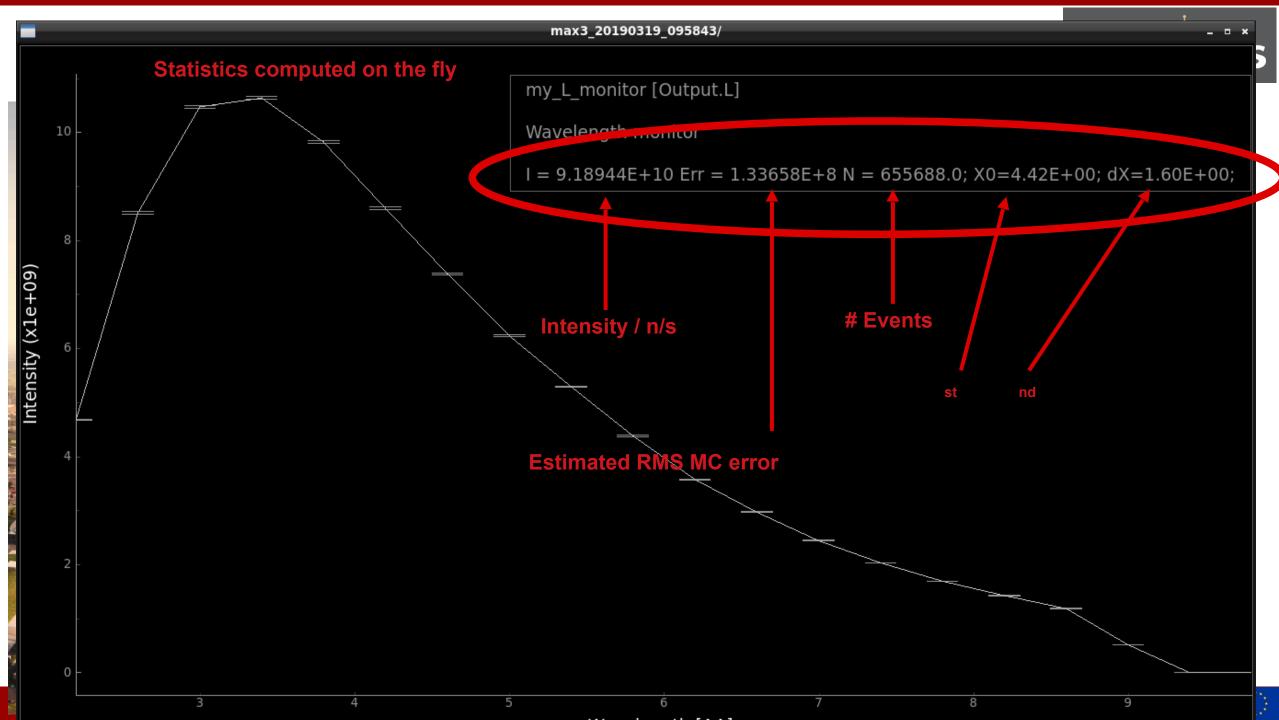

?Imagine a histogram, e.g.  $\mathbf{I}(\lambda)$ 

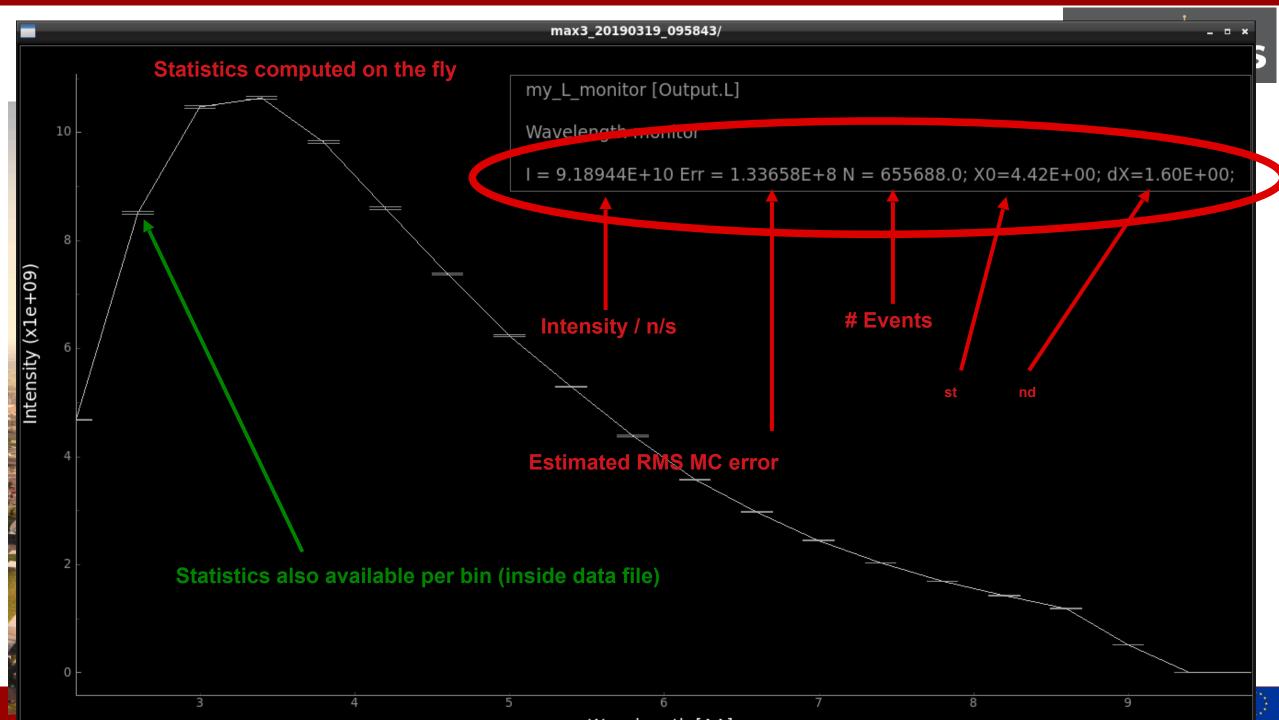

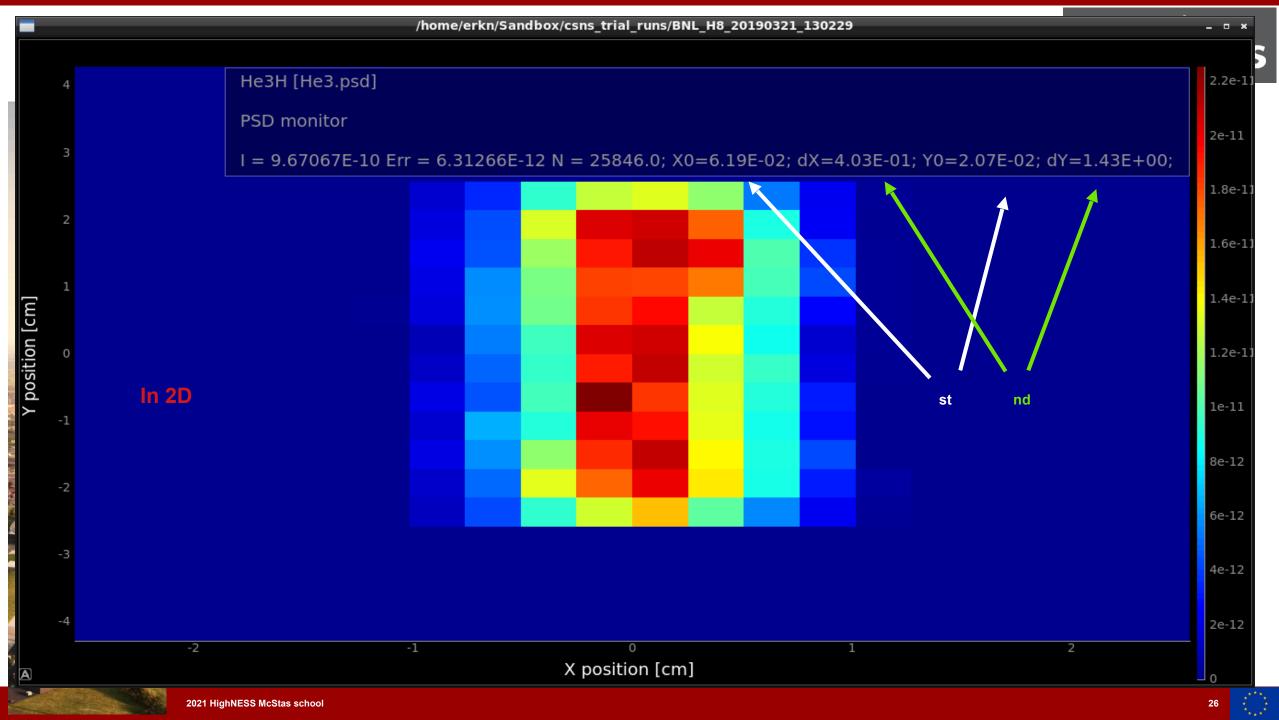

In bin i, N events each carrying a fractional intensity  $p_i$  so that

The RMS variance over that set becomes our statistical error bar *E* 

\*\*\*\*

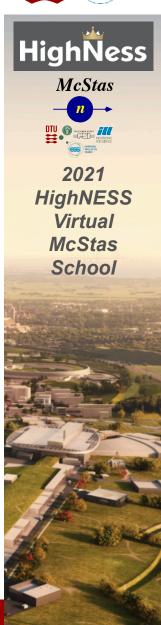

From "Virtual experiments - the ultimate aim of neutron ray-tracing simulations", K. Lefmann et al., Journal of Neutron Research 16, 97-111 (2008)

Let n be the number of neutron rays reaching the detector, and let the rays have (different) weights,  $w_i$ . The simulated intensity is then given by

$$I = \sum_{i=1}^{n} w_i. \tag{1}$$

The estimate of the error on this number is calculated in the McStas manual [1], and the standard deviation is approximated by

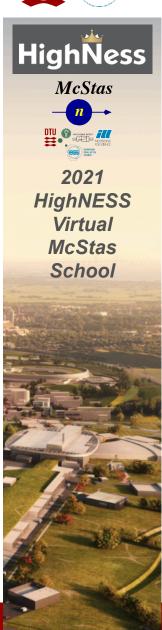

$$\sigma^2(I) = \sum_{i=1}^n w_i^2. \tag{2}$$

In real experiments,  $w_i = 1$ , whence we reach I = n and  $\sigma(I) = \sqrt{I}$  as expected (for counts exceeding 10). Let the virtual time be denoted by t. The simulated counts during this time becomes

$$C = tI, (3)$$

#### From "Virtual experiments - the ultimate aim of neutron ray-tracing simulations", K. Lefmann et al., Journal of Neutron Research 16, 97-111 (2008)

and its error bar estimate is

$$\sigma^2(C) = t^2 \sigma^2(I). \tag{4}$$

However, to simulate a realistic counting statistics, we must fulfill

$$\sigma_{\rm VE}(C_{\rm VE}) = \sqrt{C_{\rm VE}}.\tag{5}$$

This is obtained by adding to (3) a Gaussian noise  $E(\Sigma)$  of mean value zero and standard deviation  $\Sigma$ :

$$C_{\rm VE} = tI + E(\Sigma). \tag{6}$$

The standard deviation for the VE becomes

$$\sigma_{VE}^2(C) = t^2 \sigma^2(I) + \Sigma^2. \tag{7}$$

Now, the requirement (5) allows us to determine  $\Sigma$ :

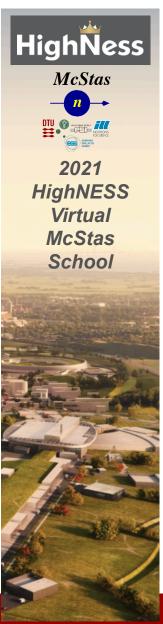

$$\Sigma^2 = tI - t^2 \sigma^2(I). \tag{8}$$

Since  $\Sigma^2$  must remain positive, we reach an upper limit on t

$$t_{\text{max}} = \frac{I}{\sigma^2(I)}.$$
(9)

# Sketch of an algorithm...

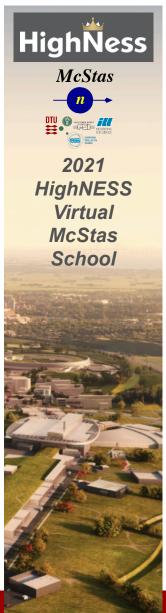

- 1. On a given McStas histogram
- 2. For the non-zero bins, calculate

$$t_{\max} = \frac{I}{\sigma^2(I)}.$$

The smallest  $t_{\max}$  defines the "maximal counting time" allowed by your statistics

3. Preferably a "background" should be added - use a "known experimental value" or an estimate...

# Monitor\_nD

The all-in-one, swiss-army-knife of monitors

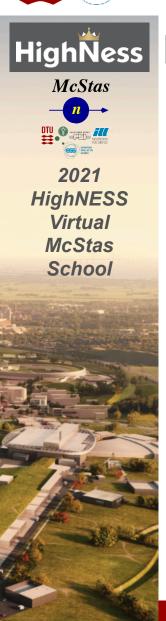

Monitor\_nD can have almost any shape, and record

any requested standard quantities

# HighNess Monitor\_nD

**Examples** 

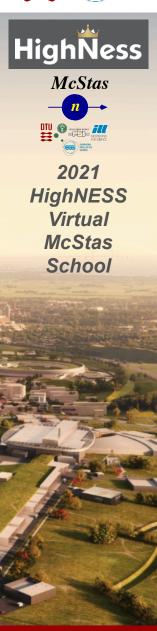

```
COMPONENT MyMon = Monitor nD( xwidth = 0.1, yheight = 0.1, zdepth = 0,
                  options = "intensity per cm2 angle, limits=[-5 5],
                  bins=10,with borders, file = mon1")
```

options = "banana, theta limits=[10,130], bins=120, y"

options = "multiple kx ky kz, auto abs log t, and list all neutrons"

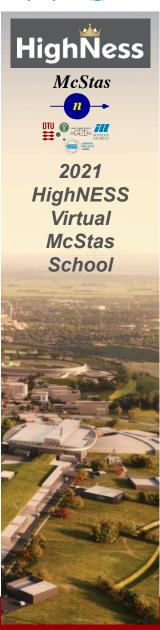

# Monitor\_nD

... or monitor just about anything:

```
COMPONENT MyMon = Monitor_nD(xwidth = 0.1, yheight = 0.1,
    user1=age, username1="Age of the Captain [years]",
    options="user1, auto")
```

#### **Exercise 2:**

Head over to the github site and continue the exercise we started before:

https://github.com/McStasMcXtrace/Schools/tree/master/ISIS\_April\_2021/ Tuesday\_April\_13th/2\_Component\_Basics/Exercise/
